One Login for Every Dock, Device, and Distribution Center

A warehouse associate clocks in and opens three systems before touching a pallet. WMS. Time clock. Scanner app. Now someone wants them to remember a fourth username and password for LoadProof. They will forget it. IT will get the ticket. The password will end up on a sticky note.

Okta SSO warehouse integration removes all of that. LoadProof connects directly to your organization's Okta identity provider, so employees sign in with the same corporate credentials they already use every day. One secure login for every user. Fewer passwords to manage. Less administrative overhead for IT.

Centralized warehouse authentication means access flows from a single source of truth. When a new employee joins, their Okta profile grants them LoadProof access automatically. When someone leaves, access disappears across every system at once. Single sign on warehouse access turns identity management from a per-app headache into a one-time configuration.

How Okta SSO Warehouse Integration Works

- 1. Single Sign On Warehouse Access**
 Employees use the same Okta credentials they already know. With Single Sign-On, users authenticate through your organization's existing login system rather than managing separate LoadProof credentials. Familiar experience. Zero training required. They sign in once and access LoadProof across web and mobile without authenticating again.
- 2. Okta Identity Management Supply Chain**
 IT manages user authentication through Okta, not through a separate application console. A single identity management framework helps enforce access controls consistently across all locations. Multi-factor authentication, session timeouts, and conditional access rules apply to LoadProof exactly as they apply to every other enterprise application.
- 3. Centralized Warehouse Authentication**
 With user provisioning tied to your identity management system, employees can access LoadProof as soon as their corporate account is activated. IT teams avoid manual account setup, credential distribution, and the administrative effort that comes with managing separate user accounts.
- 4. Okta SSO Mobile Access**
 Teams work from different locations and devices, but authentication remains consistent throughout the organization. Users gain secure access to LoadProof while IT maintains visibility and control from a single identity platform.
- 5. Warehouse User Access Control**
 Authentication and authorization work together to strengthen security. Okta verifies user identity, while LoadProof controls access to sites, facilities, dashboards, and operational data based on assigned permissions.

Why IT and Operations Teams Choose Okta SSO

Credentials never live inside LoadProof. Okta enforces password policies, rotation schedules, and MFA requirements, not individual application settings. Compliance audits become simpler when every application authenticates through the same verified identity provider.

Employees use one set of credentials across every business application, reducing password-related support tickets and freeing IT from routine credential management.

And adding a new facility does not mean adding a new authentication project. Enterprise SSO logistics scales with your footprint, not against it. Centralized user access management across every warehouse, distribution center, and corporate office from a single identity provider.

Bring LoadProof into your organization's existing authentication ecosystem. Okta SSO warehouse integration gives your employees the access they need with the credentials they already have, and gives IT the control they need without the tickets they do not want.
